

Non Herbicidal Control of Rhododendron Cut Stumps.

Rhododendron Control Method Trialled in Killarney National Park.

The method used for this trial is a form of bud rubbing. In this case a wire brush was used to carefully remove all visible growth nodes on the stump collar, no herbicide solution was used in this trial.

All treated stumps in this trial subsequently produced varying levels of regrowth as shown in above photograph and had to be retreated by removing the regrowth and applying a herbicide solution to the stump collars.
